

**A STUDY ON SATISFACTION LEVEL OF
WORK-LIFE BALANCE AMONG
TEACHERS IN ST THOMAS COLLEGE,
THRISSUR**

**ST. THOMAS COLLEGE (AUTONOMOUS),
THRISSUR**

DEPARTMENT OF STATISTICS

SIXTH SEMESTER

B.Sc. STATISTICS

2024-2025

ST. THOMAS COLLEGE (AUTONOMOUS), THRISSUR

Affiliated to the University of Calicut

CERTIFICATE

This is to certify that the project report entitled “**A STUDY ON SATISFACTION LEVEL OF WORK-LIFE BALANCE AMONG TEACHERS IN ST THOMAS COLLEGE, THRISSUR**” is a record of Bonafide work carried out by Ananya C V, Nandita Gireesh, Soniya V S under the guidance of Dr. Nicy Sebastian and this report is worth submitting for the Degree of Bachelor of Science in Statistics, University of Calicut.

ACKNOWLEDGEMENT

First of all, we are obliged to the God Almighty for the blessings he has bestowed on us throughout this Project.

We are also thankful to our Principal Rev. Dr. Martin K.A, for giving us the permission to conduct this project.

We are extremely grateful to the Head of the Department of Statistics, Dr. Sajesh T A, Assistant Professor, Department of Statistics, who rendered his valuable guidance at the initial stage of the project.

We owe sincere gratitude to our guide, Dr. Nicy Sebastian, Assistant Professor, Department of Statistics, for his valuable and inspiring guidance throughout the course of our work and in the preparation of this project report.

We are highly indebted to our class mentor and teacher in charge, Dr. Nicy Sebastian, Assistant Professor, Department of Statistics, without whose constructive feedback this project would not have been a success.

We gratefully acknowledge our gratitude to teachers of the Department of Statistics for their assistance in preparation of this project work.

We deeply thank them for their valuable suggestions and wholehearted support without which the project would not have been completed.

Finally, we wish to thank our beloved family members for their help and support. Further we thank all library authorities and our friends who helped us at various stages of our work and for their moral support and prayers.

ANANYA C V

NANDITHA GIREESH

SONIYA V S

CHAPTER-1: INTRODUCTION

1.1 INTRODUCTION

Work-life balance (WLB) is a crucial factor in determining job satisfaction and overall well-being among employees in any profession. For teachers, achieving a balance between professional responsibilities and personal life is particularly significant, as their work often extends beyond the classroom into lesson planning, evaluations, research, and student mentoring. The ability to maintain a harmonious work-life balance directly impacts job satisfaction, mental health, and overall productivity. This study focuses on assessing the satisfaction level of work-life balance among teachers in St. Thomas College, Thrissur.

Teaching is a demanding profession that requires dedication, time management, and emotional investment. In institutions like St. Thomas College, teachers come from diverse backgrounds and work under different employment categories such as aided, self-financing, and guest lecturers. Each category experiences unique challenges in balancing their professional and personal lives. Aided lecturers, who have more job security, might face different challenges compared to self-financing or guest lecturers, who may experience job uncertainty and financial instability. Understanding the levels of satisfaction with work-life balance across these categories can help in formulating policies that enhance overall well-being.

The impact of demographic factors such as age, gender, marital status, and experience on work-life balance satisfaction is another essential aspect of this study. Factors like family responsibilities, commuting time, and workload distribution can affect how teachers perceive their work-life balance. Identifying these factors and their influence can help administrators

and policymakers create supportive work environments that cater to the diverse needs of educators.

Furthermore, the study aims to explore the relationship between job satisfaction and work-life balance. A well-balanced work and personal life can lead to greater job satisfaction, reduced stress, and increased efficiency. On the other hand, an imbalance may result in burnout, decreased motivation, and reduced job performance. By analyzing this relationship, the study seeks to provide insights that can contribute to enhancing teachers' professional experiences and overall well-being.

By conducting this research, we aim to provide valuable insights into how teachers at St. Thomas College, Thrissur, perceive their work-life balance and the factors that influence their satisfaction levels. The findings can help in recommending strategies to improve the work environment, thereby fostering a healthier, more productive academic setting.

1.2 OBJECTIVES OF THE STUDY

- ❖ To assess the satisfaction level of Work-Life Balance among the teachers in St. Thomas College.
- ❖ To study the impact of demographic factors such as gender, marital status, family type, and on the satisfaction level of Work-Life Balance of teachers in St. Thomas College, Thrissur.
- ❖ The study examines the role of workload, working hours, weekend work, and administrative responsibilities in shaping work-life balance.
- ❖ The study considers the impact of departmental and colleague support in overall work-life balance satisfaction.
- ❖ To study the Work-Life Balance Satisfaction among Aided, Self-Financing, and Guest Lecturers.
- ❖ To study the relation between level of satisfaction on work-life balance and job.

1.3 SCOPE OF THE STUDY

- ❖ Involving a wider range of institutions and faculty demographics would enhance generalizability.
- ❖ Investigating institutional policies, culture, and support systems would provide insights into systemic issues.
- ❖ Tracking changes in work-life balance over time could provide valuable insights into the impact of interventions and changing work patterns.
- ❖ Comparative analysis: Comparing findings across different institutions or countries could provide valuable insights into best practices.

1.4 LIMITATIONS OF THE STUDY

- ❖ The study was restricted to St Thomas College Thrissur, hence the result obtained cannot be generalized as whole.
- ❖ The attitude of respondents may change, so the study is valid for specific period only.
- ❖ The sample size is restricted to only 101 respondents from a huge population due to difficulties in getting adequate response.
- ❖ There are possibilities of error owing to the respondents prejudice and bias while supplying the data.
- ❖ There are chances of bias in primary data because of the presence of human element.

CHAPTER 2: METHODOLOGY

2.1 TERMINOLOGY USED

Population and Sample: The collection of all units of a specified type in a given region at a particular point or a period of time is termed as a population. One or more sampling units are selected from the population according to some specified procedure. A sample consists only of a portion of the population units. Such a collection of units is called the sample. The total number of sampling units in the population is the population size, generally denoted by N. The population size can be finite or infinite (N is large).

2.2 POPULATION COVERED

The group of individuals (elements) defined according to the aim of the survey is called population or universe. The word population is used to denote the aggregate from which the sample is chosen. The population should be defined in clear and unambiguous terms.

In this survey the population selected is the Teachers of St. Thomas College (Autonomous), Thrissur. The data is collected by using questionnaires prepared by the team members with the guidance of the guide.

2.3 SAMPLING TECHNIQUE

The sampling techniques selected in administering the questionnaire is stratified sampling to ensure a fair and representative selection of teachers from St. Thomas College, Thrissur. The population is divided into three distinct strata based on employment type: Aided Faculty, Self-Financed Faculty, and Guest Lecturers. A proportional stratified random sampling technique is used, where the number of participants from each category is determined based on their proportion in the total teacher population. Stratified sampling is particularly useful in this study as it reduces variability within each group and improves the precision of the results.

2.4 DETERMINATION OF SAMPLE SIZE

In order to determine the sample size for the main survey, a statistical approach was used. The determination of sample size is based on the confidence level, margin of error, and effect size. For this study, the calculations are based on the sample size formula for finite populations.

The sample size is determined using the following formula:

$$n = \frac{\left[\frac{z^2 * p * (1 - p)}{E^2} \right]}{\left[\frac{1 + \left(\frac{z^2 * p * (1 - p)}{E^2 * N} \right)}{E^2 * N} \right]}$$

Where:

n = Required sample size

z = Z-score corresponding to the confidence level (1.96)

p = Population proportion (assumed to be 0.5 for maximum variability)

E = Margin of error (0.05)

N = Population size (177)

2.5 SOURCE OF STATISTICAL DATA

The sources of data were primary data, collected from the Teachers of St Thomas(Autonomous) College, Thrissur using questionnaire. A set of questions was prepared according to the objectives and it was distributed among the Teachers and were asked to fill it. Survey data obtained from the questionnaire was then classified, tabulated and analysed.

2.6 PREPARATION OF QUESTIONNAIRE

A questionnaire is a research instrument that consists of a number of questions that the respondents have to answer in a set format. An open-ended question asks the respondent to formulate his own answers, where a close-ended question has the respondent to pick up the answer from a given number of options. The response option for a close- ended question should be exhaustive and mutually exclusive. Mostly close - ended questions were included in the questionnaire. The closed ended questions made it easier to compare the views of the respondents. 29 questions which were required enough to collect data for the evaluation of

the objectives. The questionnaire was prepared by the team members under the supervision of the guide. The collected data was then collated and analysed using SPSS and R. These are statistical package tools used for presenting and analysing data.

2.7 DIAGRAMS AND CHARTS

A diagram is a visual form of presentation of statistical data, highlighting basic facts and relationship. Though diagrams do not add any new meaning to the statistical facts, yet they exhibit the result more clearly.

2.7.1 Bar Chart

A bar graph is a graph that presents categorical data with rectangular bars with heights or lengths proportional to the values that they represent. Each bar represents each category and the height of bar represents the value of each category. The bars can be plotted vertically or horizontally.

2.7.2 Pie Chart

A special chart that uses “pie slices” to show relative sizes of data. It is a really a good way to show relative sizes. A pie chart is a specialized chart used in statistics.

2.7.3 Column Chart

A cylindrical chart is a type of graph used to display data over time, with a circular or cylindrical shape allowing for easy comparison of values across different categories.

2.7.4 Cone chart

A cone chart is a 3D graphical representation that displays data in the shape of a cone, with the height and base of the cone representing different values or categories.

2.7.5 Doughnut chart

A doughnut chart is a circular graph with a hollow center, used to display how different categories contribute to a whole, with the size of each segment representing its proportion.

2.8 STATISTICAL TESTS

2.8.1 Chi - square test

The chi- squared test is a test of association. It is used when we have nominal data in form of frequency, and when each and every observation is independent of the all the other observation. Studies often collected data on categorical variables that can be summarized as a series of count. These counts are commonly arranged in a tabular format known as contingency table. The chi square test statistic can be used to evaluate whether there is an association between m rows and n columns in a contingency table. The equation used to conduct chi - square test of independence in statistical analysis.

$$\chi^2 = \frac{\sum (O_i - E_i)^2}{E_i} \sim \chi^2_{(m-1)(n-1)}$$

O_i = Observed frequency

E_i = Expected frequency

m and n are the number of rows and columns of the contingency table.

2.8.2 Cramer's V

Cramer's V is a statistical measure used to determine the strength of the association between two categorical variables. It is a correlation coefficient that ranges from 0 to 1, with higher values indicating a stronger association between the two variables.

$$V = \sqrt{\frac{\chi^2}{n(k-1)}}$$

Where, n- number of observations,

k- smaller of number of levels of two variables

CHAPTER 3: STATISTICAL ANALYSIS

In order to interpret the data in a scientific manner according to our objectives, the data is subjected to statistical analysis. Descriptive statistics try to describe the relationship between variables in a sample or population and provides a summary of the data in the form of diagrams and charts. In inferential statistics the data are analysed by performing hypothesis tests like chi-squared test.

3.1 Examining the impact of Gender on Satisfaction level of Work-life balance

This objective aims to explore the relationship between gender and satisfaction levels of work-life balance, examining whether men and women differ in their perceptions of work-life balance and identifying factors that influence these differences.

Gender	No of persons
Male	23
Female	54

Table 3.1-Gender of respondents

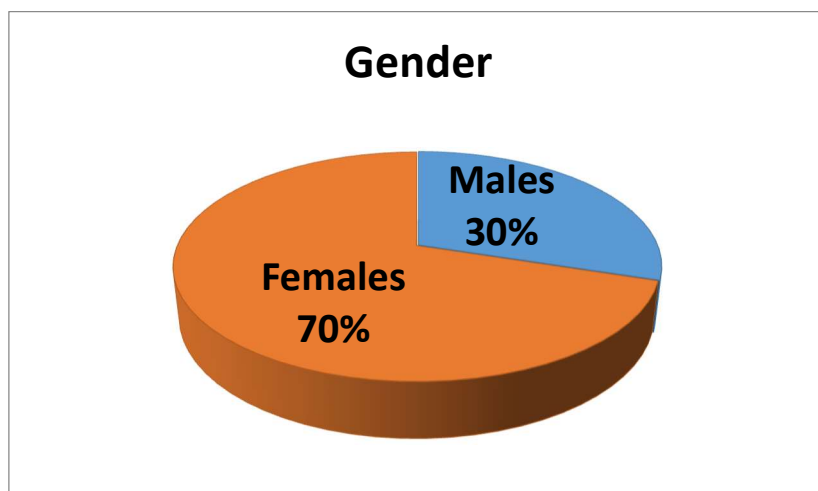

Figure 3.1- Pie chart showing the Gender of Respondents

From Figure 3.1 we can see that the majority of respondents are females and only 30% of respondents are males.

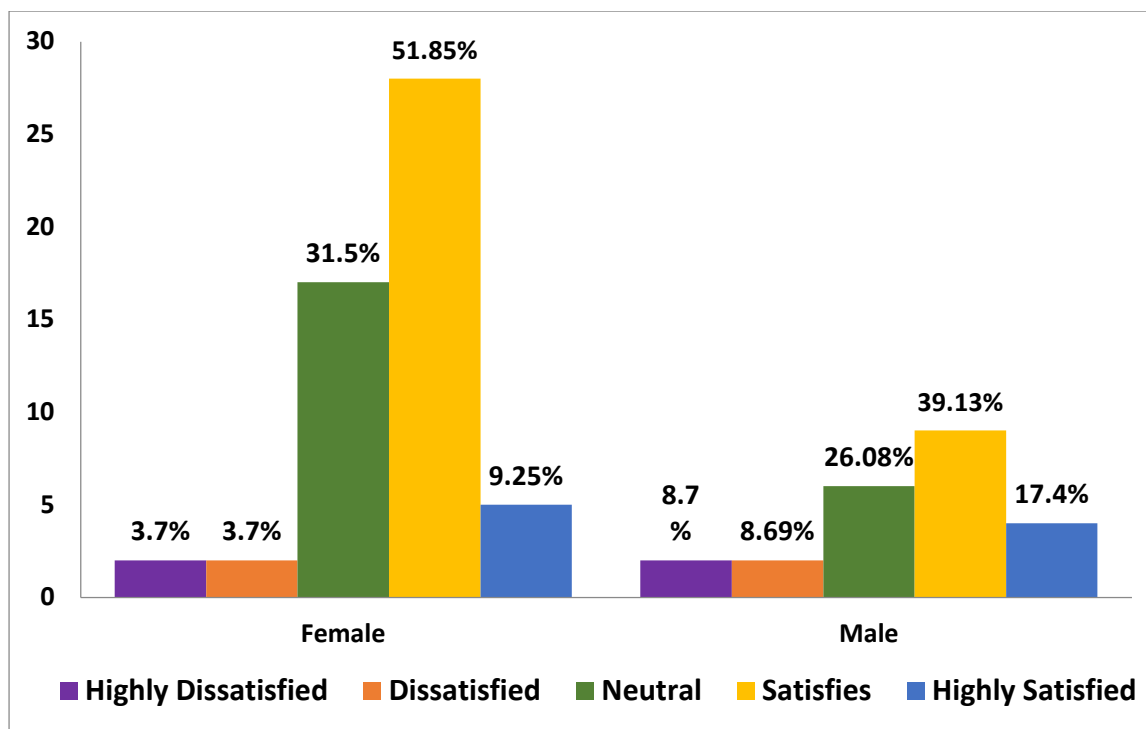

Figure 3.2-Multiple Bar graph showing Satisfaction level work-life of teachers regarding gender

The Figure 3.2 indicates that in both male and female majority of them says that they are satisfied with their work-life balance.

Relation between Gender and Satisfaction level on work-life balance

Here we are going to analyse the relationship between gender and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between the Gender and satisfaction level of Work-Life Balance .

H₁ : There is association between the Gender and satisfaction level of Work-Life Balance.

The result of chi square test for independence is given below.

Chi square statistic	p-value
3.643	0.441

Table 3.2- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has no association on gender.

3.2 Examining the impact of Marital status on Satisfaction level of Work-life balance

This objective aims to explore the relationship between marital status and satisfaction levels of work-life balance, and examine whether satisfaction levels of work-life balance differ over and married and unmarried individuals.

Table 3.3 – Marital status of respondents

Marital Status	No of persons
Married	68
Unmarried	12

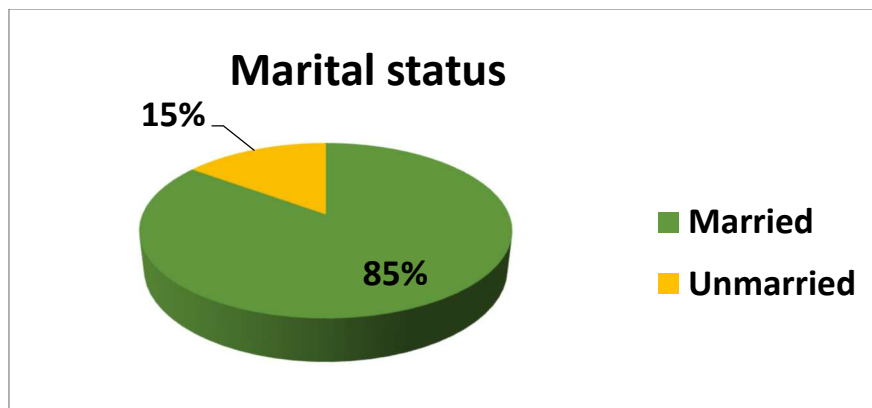

Figure 3.3- Pie chart showing the marital status of Respondents

From Figure 3.3 we can see that the majority of respondents are married and only 15% of respondents are unmarried.

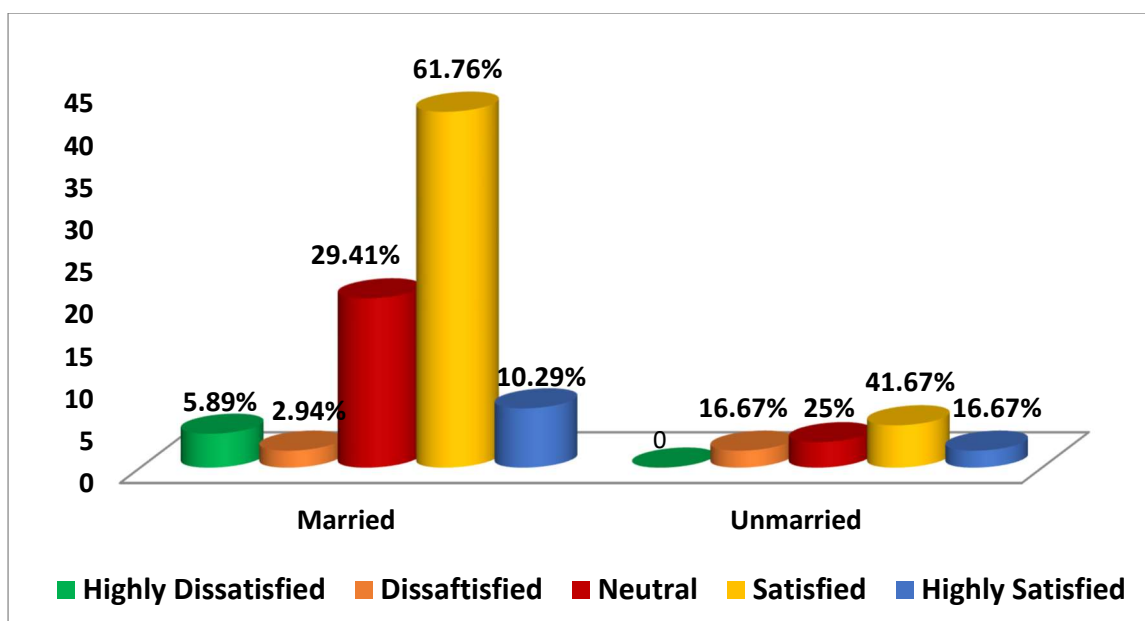

Figure 3.4- Clustered cylinder showing Satisfaction level work-life of teachers regarding marital status

From Figure 3.4, we can say that married teachers report higher satisfaction, with 42 indicating they are satisfied, while unmarried teachers have a lower count in all categories, but majority says satisfied. Dissatisfaction is minimal for both groups, suggesting a generally positive perception of work-life balance among teachers.

Relation between Marital status and Satisfaction level on work-life balance

Here we are going to analyse the relationship between Marital status and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between the Marital status and satisfaction level of Work-Life Balance .

H₁ : There is association between the Marital status and satisfaction level /of Work-Life Balance.

The result of chi square test for independence is given below.

Chi square statistic	p-value
4.180	0.333

Table 3.4- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has no association on marital status.

3.3 Examining the impact of Designation on Satisfaction level of Work-life balance

This objective aims to explore the relationship between designation and satisfaction levels of work-life balance, and examine whether satisfaction levels of work-life balance differ over the designation of respondents.

Designation	No of persons	Percentage
Professor	2	2.6%
Assistant Professor	53	68.83%
Guest lecture	19	24.67%
Associate Professor	3	3.9%

Table 3.5-Designation of Respondents

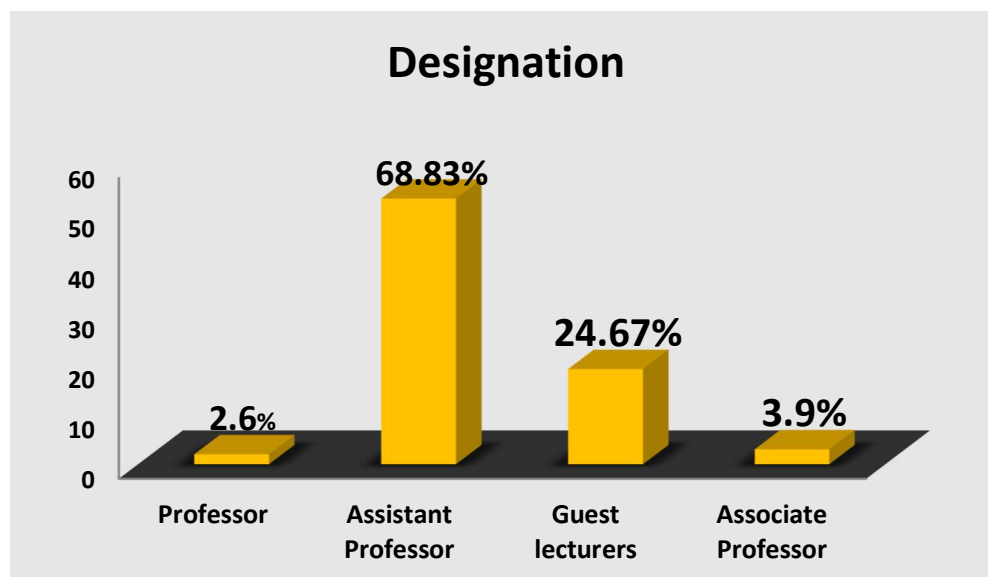

Figure 3.5 – Bar chart on Designation of respondents

Relation between Designation and Satisfaction level on work-life balance

Here we are going to analyse the relationship between Designation and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between the Designation and satisfaction level of Work-Life Balance .

H₁ : There is association between the Designation and satisfaction level of Work-Life Balance.

The result of chi square test for independence is given below.

Chi square statistic	p-value
6.12	0.953

Table 3.6- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has no association on designation.

3.4 Examining the impact of family type on Satisfaction level of Work-life balance

This objective aims to explore the relationship between family type and satisfaction levels of work-life balance, and examine whether satisfaction levels of work-life balance differ over the family type of respondents.

Family Type	No of Responses
Nuclear	58
Joint	19

Table 3.7-Family type of respondents

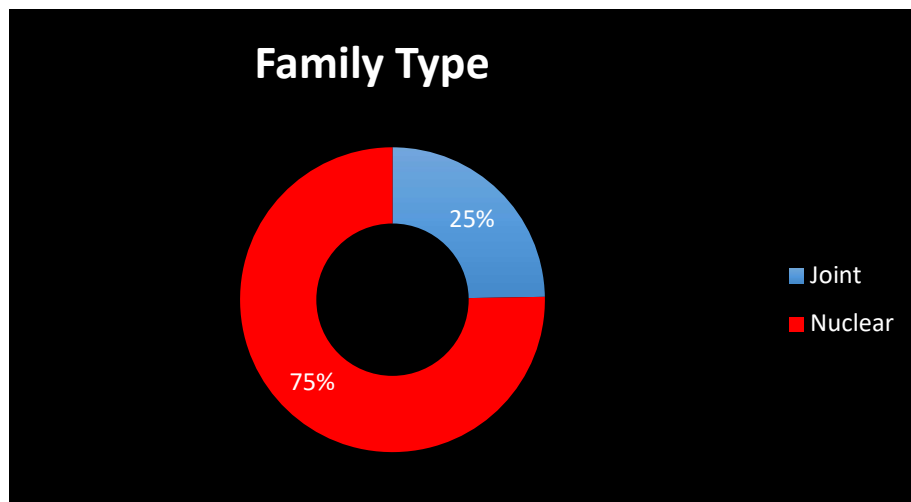

Figure 3.6 –Doughnut chart showing family type of respondents

From Figure 3.6 we can see that the family type majority of respondents is Nuclear and only 25% of respondent live in a Joint family.

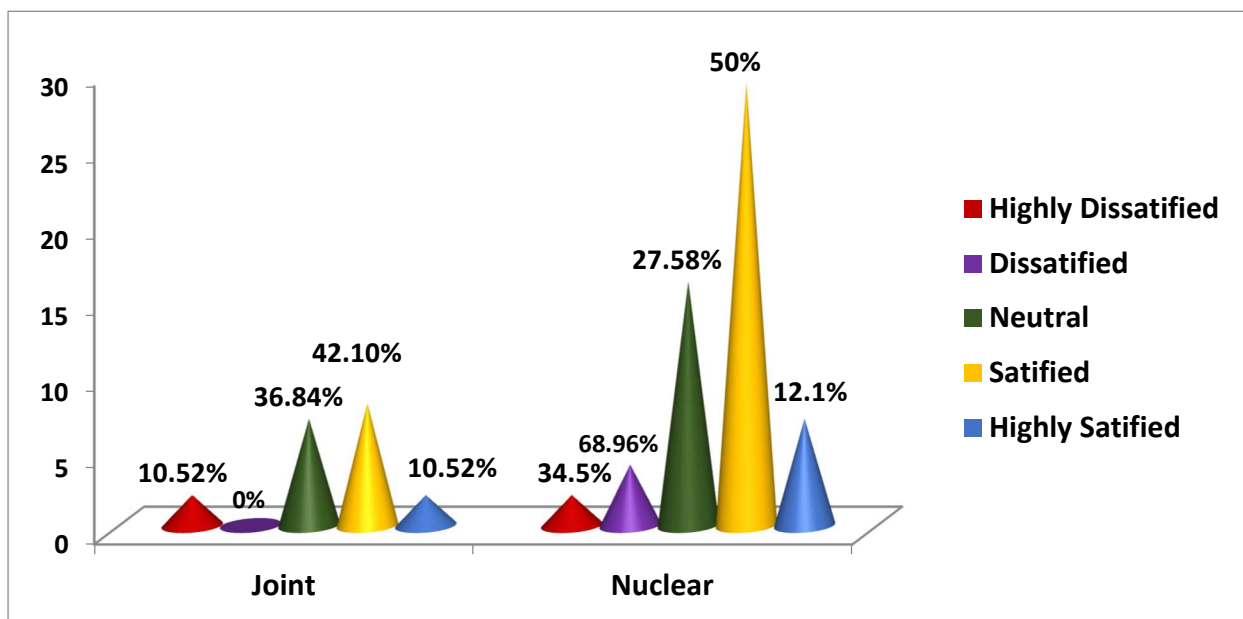

Figure 3.7- Cone chart showing Satisfaction level work-life of teachers regarding Family type

The figure 3.7 illustrates teachers' responses on their family type (Joint or Nuclear) and their satisfaction with work-life balance, categorized into five levels. It shows that teachers from nuclear families report higher satisfaction levels compared to those from joint families, with a significant peak in the "Satisfied" category.

Relation between Family type and Satisfaction level on work-life balance

Here we are going to analyse the relationship between Family type and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between the Family type and satisfaction level of Work-Life Balance .

H₁ : There is association between the Family type and satisfaction level /of Work-Life Balance.

The result of chi square test for independence is given below.

Chi square statistic	p-value
3.037	0.522

Table 3.8- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has no association on Family type.

3.5 Examining the impact of Employment type on Satisfaction level of Work-life balance

This objective aims to explore the relationship between family type and satisfaction levels of work-life balance, and examine whether satisfaction levels of work-life balance differ over the family type of respondents.

Employment Type	No. of responses	Percentage
Aided	32	42%
Self-Financing	29	38%
Guest Lecturer	16	21%

Table 3.9-Employment type of respondents

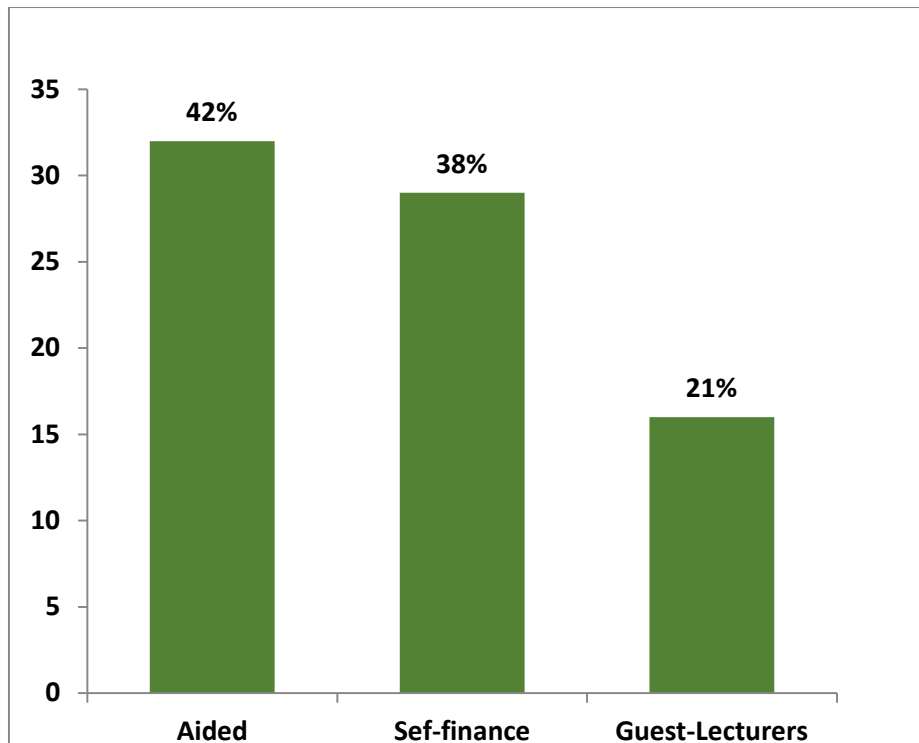

Figure 3.8-Bar chart showing the employment type of respondents

From Figure 3.8, we can see that the employment type of majority of respondents is aided and least response is from Guest lecturers.

Relation between Employment type and Satisfaction level on work-life balance

Here we are going to analyse the relationship between Employment type and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between the Employment type and satisfaction level of Work-Life Balance .

H₁ : There is association between the Employment type and satisfaction level of Work-Life Balance.

The result of chi square test for independence is given below.

Chi square statistic	p-value
4.219	0.8743

Table 3.10- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has no association on employment type.

3.6 Examining how work's impact on personal life influences Work-life balance satisfaction

This objective aims to examine whether there is any association between work's impact on personal life and satisfaction levels of work-life balance.

Work's impact on personal life	No of Responses	Percentage
Yes	42	56%
No	33	44%

Table 3.11-Work's impact on personal life

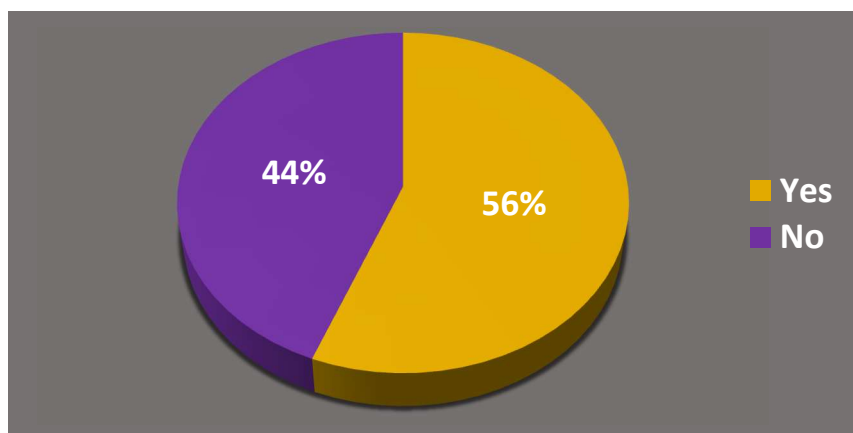

Figure 3.9-Pie chart showing the Work's impact on personal life

From figure 3.9 We can see that 56% of respondents says that yes their work interferes their personal life.

Relation between work's impact on personal life and Satisfaction level on work-life balance

Here we are going to analyse the relationship between work's impact on personal life and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between the work's impact on personal life and satisfaction level of Work-Life Balance .

H₁ : There is association between the work's impact on personal life and satisfaction level of Work-Life Balance.

The result of chi square test for independence is given below.

Chi square statistic	p-value	Cramers' V
11.532	0.01232	0.020

Table 3.12- The result of chi square test for independence

INFERENCE

Since p value is less than 0.05, we reject the null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has association on the variable work's impact on personal life. Cramers' V value of 0.020 indicates a very weak association between the variables work's impact on personal life and satisfaction level of work-life balance.

3.7 Examining how taking the work home influence work-life balance satisfaction

This objective examines whether employees who frequently take work home tend to have lower satisfaction levels with their work-life balance compared to those who do not take work home.

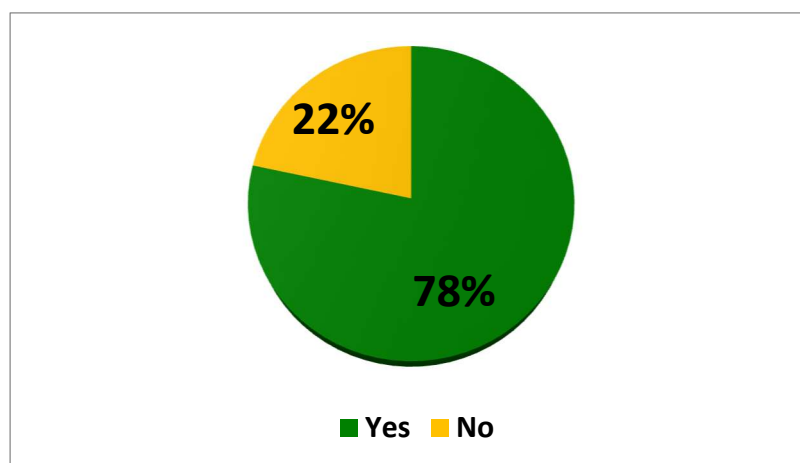

Figure 3.10-Pie chart showing frequency of teachers taking work home

From Figure 3.10 we can see that the majority of respondents says yes they take their work home.

Association of Satisfaction level of work-life balance on taking work home

Here we are going to analyse the relationship between work's impact on personal life and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : Taking work home has no association on satisfaction level of Work-Life Balance .

H₁ : Taking work home has an association on satisfaction level of Work-Life Balance .

The result of chi square test for independence is given below.

Chi square statistic	p-value
6.802	0.1052

Table 3.13- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that on taking work home has an no association on satisfaction level of Work-Life Balance .

3.8 Examining the Impact of Weekend/Holiday Work on Work-Life Balance Satisfaction

This objective examines how often working on weekends/holidays affects teachers satisfaction with their work-life balance. Here we try to understand whether frequent weekend/holiday work is linked to lower satisfaction with work-life balance.

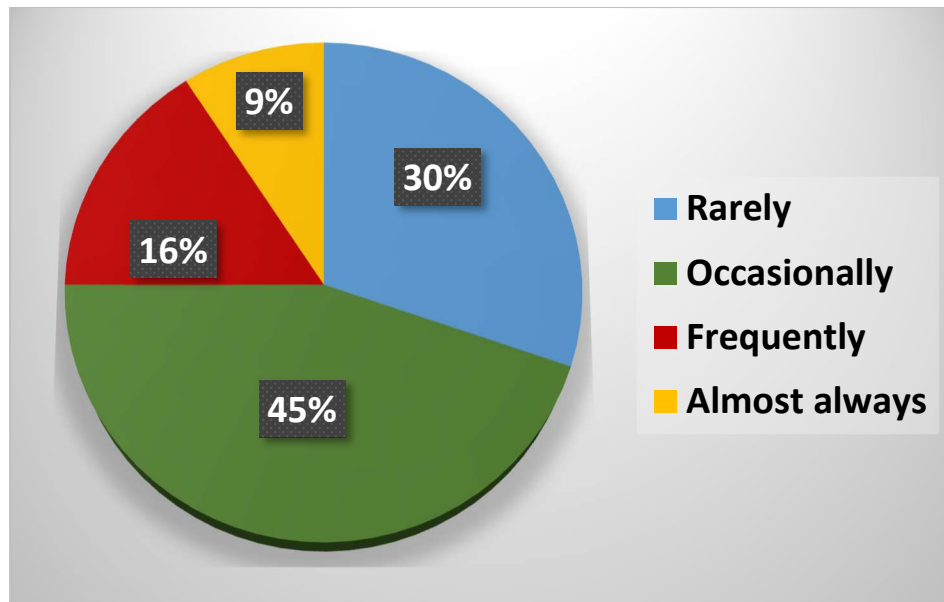

Figure 3.11-Pie chart showing frequency of teachers working on weekends or holidays

From Figure 3.11 We can say majority of them says they only occasionally work on weekends or holidays.

Association of Satisfaction level of work-life balance on frequency of teachers working on weekends or holidays

Here we are going to analyse the relationship between frequency of teachers working on weekends or holidays and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : Frequency of teachers working on weekends or holidays has no association on satisfaction level of Work-Life Balance .

H₁ :Frequency of teachers working on weekends or holidays has an association on satisfaction level of Work-Life Balance .

The result of chi square test for independence is given below.

Chi square statistic	p-value
16.607	0.07718

Table 3.14- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that the habit working on weekends or holidays has an no association on satisfaction level of Work-Life Balance .

3.9 Examining the Impact of departmental and colleagues support on Work-Life Balance Satisfaction

This objective explores the relationship between departmental and colleagues' support and work-life balance satisfaction among teachers. Here we try to understand whether support from departmental and colleagues' sources contributes to teachers' ability to balance work and personal life.

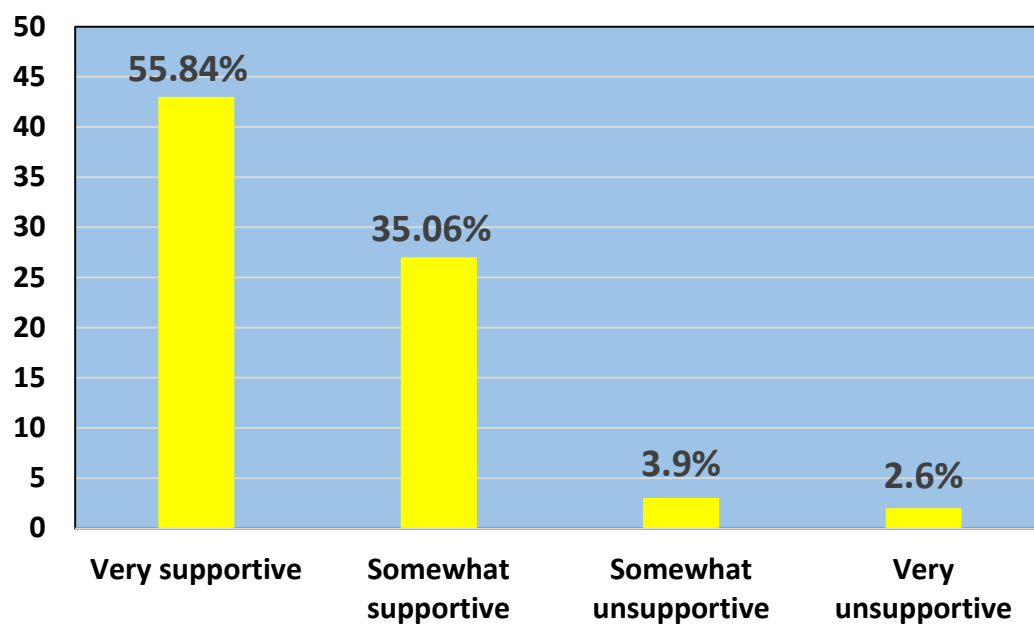

Figure 3.12-Bar graph showing the frequency of departmental and colleagues support

From Fig 3.12, we can see that majority of them says their colleagues are very Supportive.

Association of Satisfaction level of work-life balance on frequency of departmental and colleagues support

Here we are going to analyse the relationship between frequency of departmental and colleagues support and Satisfaction level on work-life balance using chi-square test for independence.

H₀ : There is no association between perceived departmental and colleague support and work-life balance satisfaction.

H₁ : There is association between perceived departmental and colleague support and work-life balance satisfaction.

The result of chi square test for independence is given below.

Chi square statistic	p-value
17.301	0.07521

Table 3.15- The result of chi square test for independence

INFERENCE

Since p value is greater than 0.05, we do not reject null hypothesis. i.e., we can conclude that there is an association between the variables perceived departmental and colleague support and work-life balance satisfaction.

3.10 Examining the relationship between Physical Health and Work-life balance satisfaction.

This objective investigates the relationship between physical health and work-life balance satisfaction, exploring whether better physical health is associated with higher work-life balance satisfaction. The goal is to understand the impact of physical health on achieving a balance between work and personal life.

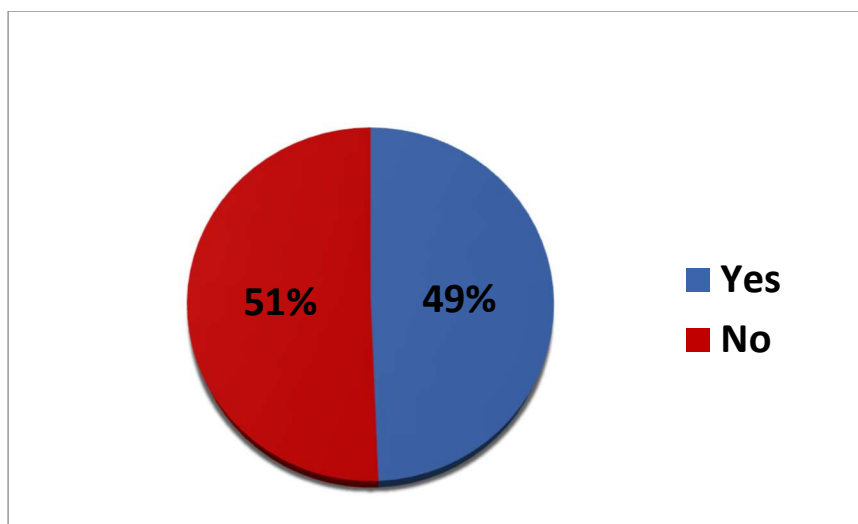

Figure 3.13-Pie chart showing the frequency of teachers suffering from health issues

From Figure 3.13 we can say that 51% of Teachers do not suffer from any of the health issues and 49% of Teachers says they suffer from health issues.

HEALTH ISSUES FACED BY TEACHERS

0

Health issues faced By Teachers	No of Responses	Percentage
Burnout	8	9.52%
Throat related issues	24	28.57%
Neck Pain	15	17.86%
Body Pain	13	15.47%
Dust Allergy issues	24	28.57%

Table 3.16-Table showing the health issues faced by teachers

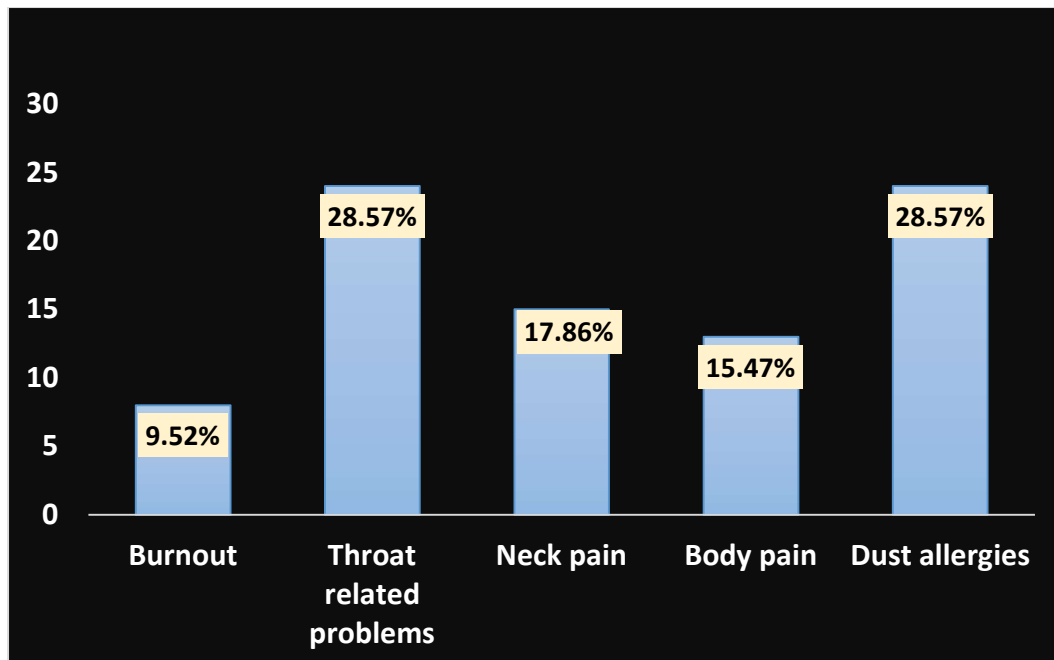

Figure 3.14-Bar chart showing the health issues faced by teachers

Other than the health issues mentioned in the above Fig 3.14 some of them faces health issues like eye related problems and inflammatory diseases.

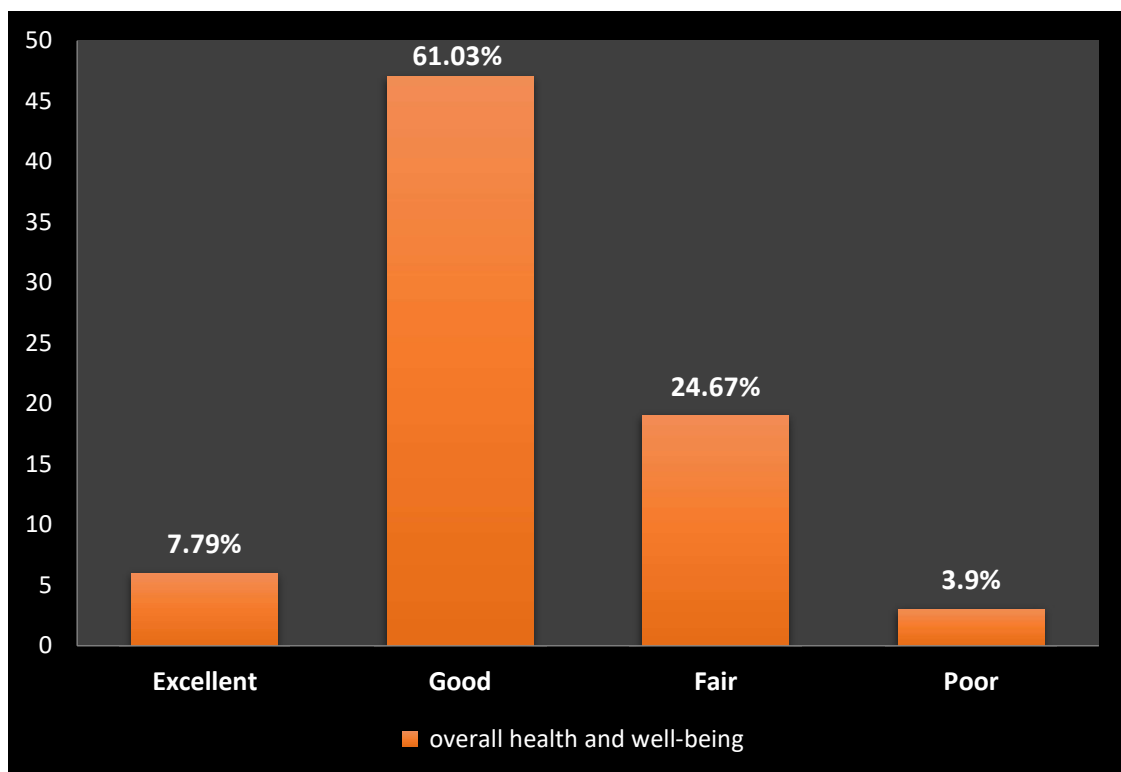

Figure 3.15- Bar chart showing Overall Health and well being of teachers

From the Figure 3.15 we can say that majority of the respondents feel that their overall health and well-being is good.

Examining the relationship between self-rated overall health and well-being and work-life balance satisfaction.

H₀ : There is no association between self-rated health and well-being and work-life balance satisfaction.

H₁ : There is association between self-rated health and well-being and work-life balance satisfaction.

The result of chi square test for independence is given below.

Chi square statistic	p-value	Cramers' V
30.023	0.0002	0.452

Table 3.17- The result of chi square test for independence

INFERENCE

Since p value is less than 0.05, we reject the null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has association on the variable self-rated health and well-being. Cramer's V value of 0.452 indicates a moderate to strong association between the variables self-rated health and well-being and work-life balance satisfaction.

3.11 Examining the impact of work-related stress/anxiety on Work-life balance satisfaction

This objective investigates the relationship between work-related stress/anxiety and work-life balance satisfaction, exploring whether higher levels of work-related stress/anxiety are associated with lower work-life balance satisfaction. The goal is to understand the impact of work-related stress/anxiety on achieving a balance between work and personal life.

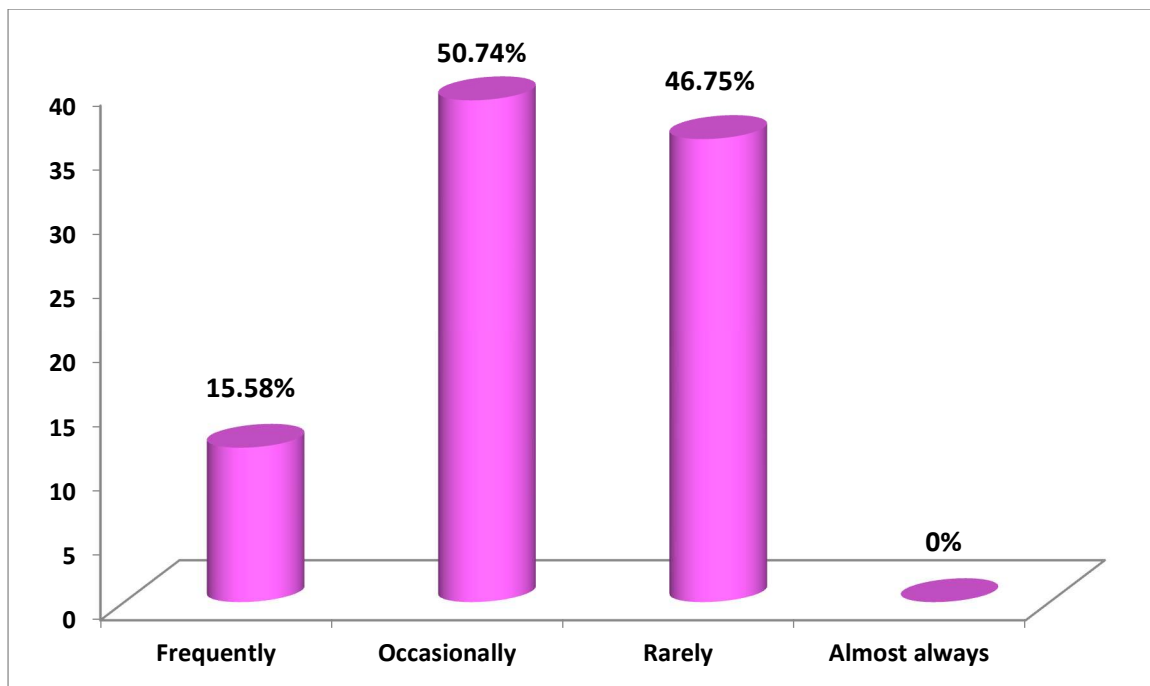

Figure 3.16- Frequency of teachers facing Work-Related Stress/Anxiety

From Figure 3.16 we can say that the majority of respondents face work-related stress or anxiety occasionally and rarely.

SOURCES OF STRESS IN TEACHING

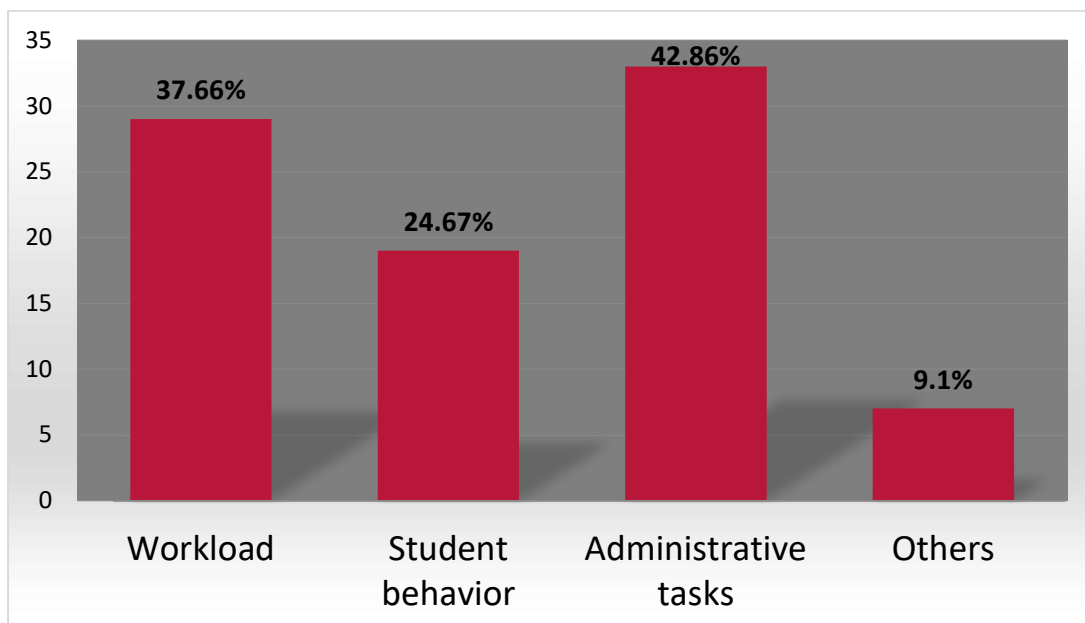

Figure 3.17-Sources of stress in teaching

Other than the stress factors mentioned in the above Figure 3.17 some of them says they face Lack of cooperation among peers and time manipulation.

Relation between work-related stress or anxiety and Satisfaction level on work-life balance

H₀ : There is no association between work-related stress or anxiety and work-life balance satisfaction.

H₁ : There is association between work-related stress or anxiety and work-life balance satisfaction.

The result of chi square test for independence is given below.

Chi square statistic	p-value	Cramers' V
14.598	0.03146	0.040

Table 3.18- The result of chi square test for independence

INFERENCE

Since p value is less than 0.05, we reject the null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has association on the variable work-related stress or anxiety. Cramer's V value of 0.040 indicates a very weak association between the variables work-related stress or anxiety and satisfaction level of work-life balance.

3.12 Examining the impact of work load on Work-life balance satisfaction

This objective investigates the relationship between work load and work-life balance satisfaction, exploring whether higher levels of work load are associated with lower work-life balance satisfaction. The goal is to understand the impact of work load on achieving a balance between work and personal life.

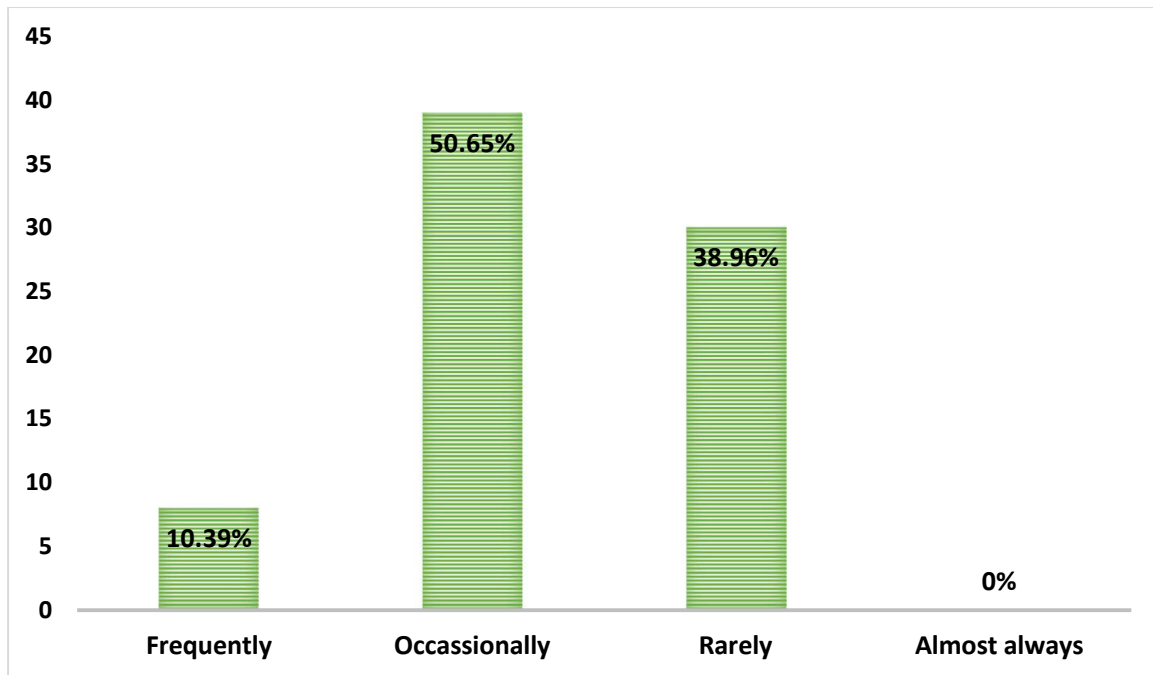

Figure 3.18-Bar chart showing frequency of teachers saying they feel overwhelmed by work demands

From the Figure 3.18 we can say that majority of the respondents says that they occasionally feel overwhelmed by work demands.

Relation between work load and Satisfaction level on work-life balance

H₀ : There is no association between work load and work-life balance satisfaction.

H₁ : There is association between work load and work-life balance satisfaction.

The result of chi square test for independence is given below.

Chi square statistic	p-value	Cramers' V
27.780	0.001	0.452

Table 3.19- The result of chi square test for independence

INFERENCE

Since p value is less than 0.05, we reject the null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has association on the variable work load. Cramer's V value of 0.452 indicates a moderate to strong association between the variables work load and Satisfaction level on work-life balance.

3.13 Examining the relation between level of satisfaction on work-life balance and job

This study explores the relationship between teachers satisfaction with their work-life balance and overall job satisfaction. It examines how maintaining a healthy balance between work and personal life impacts job fulfillment and productivity.

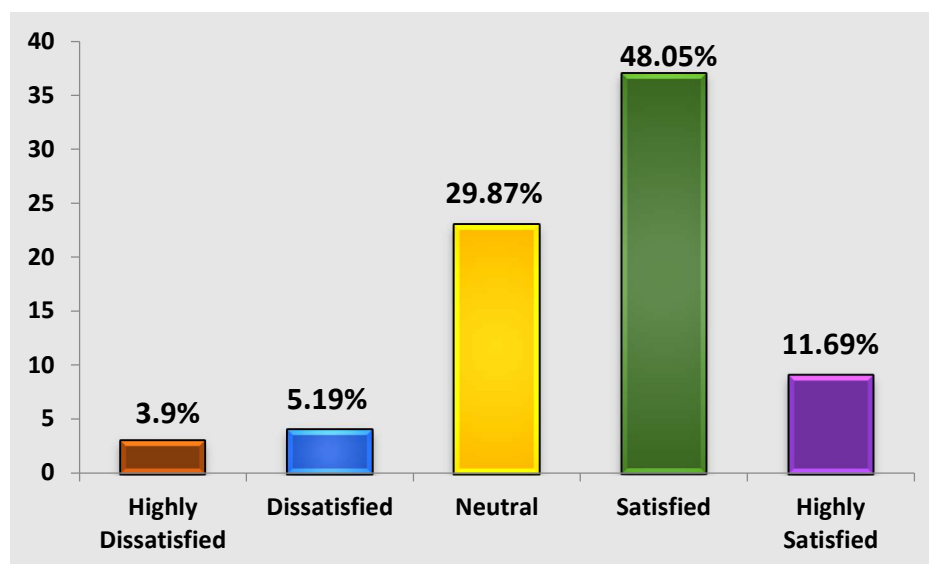

Figure 3.19-Bar chart showing the satisfaction level of work-life balance

From figure 3.19 we can say that majority of respondents says they are satisfied with their work-life balance and least majority says they are highly dissatisfied with their work-life balance.

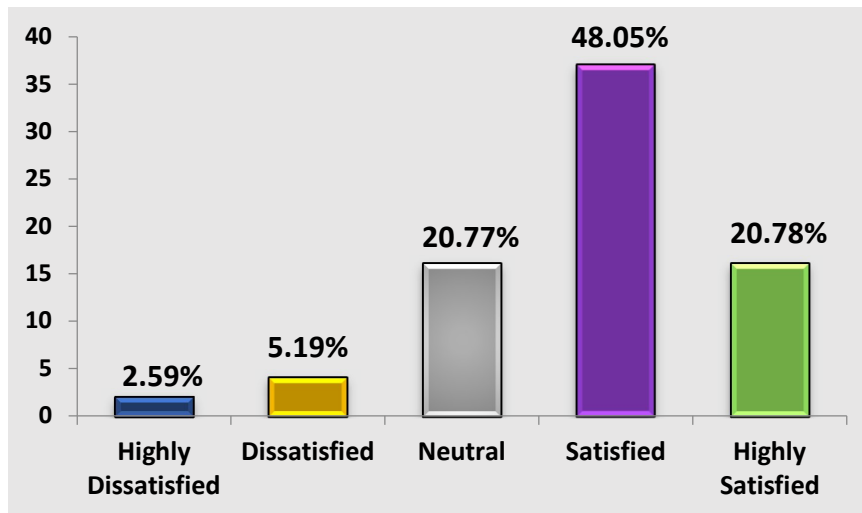

Figure 3.20-Bar chart showing the satisfaction level of job

From figure 3.20 we can say that majority of respondents says they are satisfied with their job and least majority says they are highly dissatisfied with their job.

Relation between Satisfaction level on work-life balance and Job satisfaction

H₀ : There is no association between the satisfaction level of work-life balance and job satisfaction level.

H₁ : There is association between the satisfaction level of work-life balance and job satisfaction level.

The result of chi square test for independence is given below.

Chi square statistic	p-value	Cramers' V
27.03	2.003e-07	0.557

Table 3.20- The result of chi square test for independence

INFERENCE

Since p value is less than 0.05, we reject the null hypothesis. i.e., we can conclude that satisfaction level of work-life balance has association on job satisfaction level. Cramer's V value of 0.557 indicates a strong association between the variables satisfaction level of work-life balance and job satisfaction level.

CHAPTER 4: SUMMARY AND CONCLUSION

4.1 SUMMARY

This study was conducted to analyze the satisfaction level of work life balance among teachers in St Thomas College, Thrissur. We have also tried to study the impact of demographic factors (gender, marital status, family type), designation, employment type on the satisfaction level of work life balance, the relation between work life balance satisfaction and level of job satisfaction among teachers in St Thomas college Thrissur. From the statistical analysis of the data collected from a sample of 87 teachers from the college we had come to the conclusions that achieving a healthy work-life balance is crucial for college teachers to maintain their effectiveness in the classroom and their overall quality of life.

The project explores the work-life balance of college teachers, focusing on the challenges they face in managing their professional responsibilities alongside personal life. Additionally, the study revealed that a positive work environment and supportive colleagues significantly contribute to enhancing overall job satisfaction and personal well-being. The study says that majority of teachers work interferes with their personal life.

Institutions should prioritize creating policies that support flexible work arrangements and provide resources for mental health and wellness. By fostering a supportive environment, colleges can not only enhance teachers' job satisfaction but also improve student outcomes, as teachers who feel balanced are more engaged and motivated. Future research could further investigate the long-term effects of work-life balance initiatives on teacher retention and student performance.

4.2 CONCLUSION

The study on the satisfaction level of work-life balance among teachers at St. Thomas College, Thrissur, highlights the importance of maintaining a healthy balance between professional and personal life for educators. Key findings are:

- ❖ Demographic factors such as gender, marital status, and family type did not show a significant statistical association with work-life balance satisfaction.
- ❖ However, factors like taking work home, work interfering with personal life, and workload were found to have a significant impact on satisfaction levels.
- ❖ Teachers who frequently worked beyond their scheduled hours or took work home reported lower satisfaction with their work-life balance.
- ❖ Teachers who received strong support from their colleagues and departments reported higher job satisfaction.
- ❖ Health issues, including throat-related problems and dust allergies, were prevalent among teachers, indicating a need for better workplace wellness initiatives.
- ❖ Stress from administrative duties and workload was also identified as a major concern.
- ❖ The study confirmed a strong link between work-life balance satisfaction and overall job satisfaction.

Overall, the study underscores the need for institutions to implement policies that support flexible work arrangements, reduce administrative burdens, and promote mental and physical well-being. By fostering a supportive work environment, colleges can enhance job satisfaction and overall productivity, leading to better outcomes for both teachers and students.

ANNEXURE : QUESTIONNAIRE

1. Name: _____

2. Gender:

- Male
- Female
- Other

3. Marital status:

- Married
- Unmarried
- Other

4. Educational qualification

- Ph. D
- PG

5. Designation

- Professor
- Associate Professor
- Assistant Professor
- Guest Lecturers

6. How many Years of Teaching Experience do you have : _____

7. Type of employment:

- Aided
- Self-financing
- Guest – lecturer

8. Family type:

- Nuclear
- Joint
- Not Applicable

9. Number of dependents (Including parents and children): _____

10. Is your spouse working :

- Yes
- No
- Not Applicable

11. How many hours do you spend on teaching, preparation, and grading per week?

12. Does your normal teaching hours exceed more than 16 hours in a week?

- Yes
- No

13. If yes Unofficial Extra hours worked after official timing (Daily) _____

14. How often do you work on weekends or holidays?

- Rarely
- Occasionally
- Frequently
- Almost always

15. Do you suffer from any of these health issues due to your work life:

- Yes
- No

16. If yes select the health issues you face due to your work life:

- Burnout
- Throat related problems
- Neck pain
- Body pain
- Dust allergies
- Other(please specify)

17. Do you generally feel that you are able to balance you work life.

- Yes
- No

18. Do you often take your work home?

- Yes
- No

19. How often do you experience stress or anxiety related to work?

- Rarely
- Occasionally
- Frequently
- Almost always

20. What are the main source of stress in your teaching job?

- Workload

- student behavior
- administrative tasks
- Other(Please specify)

21. How often do you feel overwhelmed by work demands?

- Rarely
- Occasionally
- Frequently
- Almost always

22. Do you feel that your work interferes with your personal life?

- Yes
- No

23. How supportive is your department/colleagues in terms of work-life balance?

- Very supportive
- Somewhat supportive
- Somewhat unsupportive
- Very unsupportive

24. How would you rate your overall health and well-being?

- Excellent
- Good
- Fair
- Poor

25. Do you have enough time to engage in regular physical activity or exercise?

- Yes
- No

26. If yes do you utilise the time to engage in any physical activity or exercise?

- Yes
- No

27. Overall how satisfied are you with your job:

- Highly Dissatisfied
- Dissatisfied
- Neutral
- Satisfied
- Highly Satisfied

28. Overall how satisfied are you with your work-life balance:

- Highly Dissatisfied
- Dissatisfied
- Neutral
- Satisfied
- Highly Satisfied
